

1. a)

First

Second

Third

Fourth

b)

First Part : identifiers can't have a space

1st : Identifiers can't start with a number

Class : The word Class is a reserved keyword for a different command

First-Place : Identifiers can't contain hyphens

5. a) Primitive Data types are already created and used data types, they follow specified rules and restrictions. Abstract data types is when a user basically creates their own program that follows the new rules and restrictions that they specify.

b) A class is the blueprint of a data structure and behaviour. While a object is the physical memory of a class that can be used and is defined.

11. a) $y = (\text{int})(j * k);$

b) I don't need to change anything as z is already defined as double so the equation and answer can fully work.

c) I don't need to change anything as z is already defined as double so the equation and answer can fully work.

d) $j = (\text{int})k;$

e) I don't need to change anything as k is already defined as a double so it can easily hold j's value of 1.

f) I would need to change nothing as j is equal to 5 then you add 3 which equals 8 which is a int so y can sustain it.
