

1. The purpose of a loop structure is for the program to bypass ever wrong answer until the correct one is found or inputted by the user. A loop structure is basically meant to continuously re-run some code until it's correct.
2. In the do-while loop the do and while would be split up and while would be at the bottom controlling how the program leaves the loop vs. a while loop would hold the while and condition (true) at the top and it would control how the loop starts.
3. Skillbuilder: Evens.
4.
 - a) A piece of code that will repeat infinitely due to a problem in the code such as a failed exit of the loop.
 - b) The exit, or wrong operations or math rules.
 - c) when a number generated or entered goes over the max limit for the for the defined data type, when this happens the number would get changed from the maximum to the minimum and would become a negative.
5. 60 times
6. Anything below 120
7. Compare: flow control and error checking. Contrast: Display and brightness regulation and computer vision. Accumulators: Doing arithmetic, and multiply accumulate operations.
8.

```
Sum = 0;
Num = 3;
For (num; num > 2 && num < 11; num ++) {
  Sum += num;
}
```
9. Condition predictability and execution timing.
11.
 - a) 9
 - b)"my "
 - c)"my string"
 - d)"MY STRING"
 - e)"my string"
