

Credit Name: CSE 2140

Assignment Name: Chapter 4 Conditional Control Structures

### ***Understanding the Problem***

How did you approach understanding the challenge:

For exercise one I understood that I would mainly need to utilize if and if-else statements for each money amount and amount of copies. Other than the if statements everything became easy.

Exercise 2 was really similar to the delivery skillbuilder I completed previously, and I realized the only difference was really the weight and multiplying the dimensions against each other.

Were there any parts of the problem you found confusing at first?

For exercise 2 there were not really any hiccups or misunderstandings, but in exercise 1 it took me a while to write the if statements as the first few times I wrote them I kept getting errors on the final else statement. So I decided to just make the last else statement into a else-if which I think is improper but it was the only way I could get the code to work.

Did you create a plan or break the problem into smaller steps before coding?

Not for exercise 2 but for exercise 1 I broke up the code into each section of the if statement, so I would make the first 2 if statements then test the code and then keep adding until it was complete.

How did you decide on the tools, data structures, or algorithms to use?

I used integers, doubles, if statements, the java.util.Scanner, and the input scanner.

Did you write the code in small pieces or attempt the entire solution at once?

Not for exercise 2 but for exercise 1 I broke up the code into each section of the if statement, so I would make the first 2 if statements then test the code and then keep adding until it was complete.

How did you test your solution along the way to make sure it was working?

I would save the code then test it using the required inputs and see if the code gradually outputted the correct numbers or words.

What part of the problem was the most difficult for you?

Figuring out the problem with my if statements in exercise 1, as until this point I had always done them correctly, so this time I felt I did them the same but there was an error. So it took me a long time to figure out what was wrong and what I had to adapt.

How did you handle moments when you felt stuck or unsure of what to do next?

When I got stuck on my if statements I turned to my friends in the class asking if they had any idea on what my problem was, and I also looked back on my previous code trying to figure out what I did differently.

Was there anything you learned that you think will help you with future challenges?

This mastery helped me understand better on how if statements work, and it also taught me how to add decimals to my outputs using the `String.format("%.2f", total)`.
